

Do You Know What's In A Vaccine?

Don't You Think You Should?

You research your baby's car seat, cot and pram - what about their vaccines?

Have you looked at the ingredients, side effects and contraindications listed on vaccine package inserts to consider if these shots are right for you and your family?

Did you know...

that doctors who question vaccine safety, effectiveness or necessity can face disciplinary action?

that the rich and well-educated have some of the lowest vaccination rates?

that babies are given the Hepatitis B shot on day of birth, when there is negligible risk for this sexually transmitted disease?

that vaccines may be contaminated with a large number of animal viruses and bacteria, some of which have been linked with cancer and other chronic diseases?

that the media considers it to be 'false balance' to report anything about vaccination that is not completely positive?

that vaccine companies have paid billions of dollars in fines in recent years due to fraudulent business practices, bribery and deceptive marketing?

that vaccines do not undergo the same rigorous scientific testing for safety or effectiveness which other drugs must go through?

that there have been no large studies done that compare all health outcomes in fully vaccinated vs fully-unvaccinated children?

that on average there are over 3,000 side effects including 4.3 deaths reported every year in Australia?

“Infectious deaths fell before widespread vaccination was implemented”

- Professor Fiona Stanley,
Australian of the Year (2003),
Child Health Since Federation,
2001
